We are pleased to offer two different sized bear traps!

As you can see from the enclosed photo, the No. 6 is unbelievably large. The weight of the trap is a whopping 46 pounds, it is 45 inches long with a jaw spread of 17 inches. A trap this size was used to catch the largest, most powerful bears. The hefty chain has a swivel and a large ring just like the old traps.

This trap is just like the traps used by the early pioneers, explorers, and trappers. These hardy people demanded quality and reliability in their equipment. This is the kind of trap they would have used. The name on the pan reads "DAKOTA FUR AND TRADE COMPANY, No. 6, HBC".

This trap represents the hardy people who made the Dakotas great. The pan is so large it's like a small frying pan. The springs are stout and made of the finest tempered spring steel and each will compress at about 375 pounds of pressure. It takes a strong vice or clamps to compress the springs!

The pan on the No. 15 trap reads "DENALI FUR AND TRADE COMPANY, HBC, No. 15". This trap weighs 24 pounds and is 36 inches long with a jaw spread of 12 inches. The cast jaws are offset and have teeth. The springs are made of the finest tempered spring steel, and each will compress at about 375 pounds of pressure. The heavy chain has a swivel and a large ring like the old traps.

Each trap has its own serial number. The serial number is stamped on the right-hand side of the frame. The No. 6 and the No. 15 both start with DFT.

These are fully functioning bear traps. Caution must be used in handling the trap. If you wish to display the trap in an open position, the trigger dog must be tack welded into the pan AND the pan must be immobilized in the "up" position and welded. The temper of the springs MUST also be removed so the spring will stay in the down position. This can be accomplished with the aid of a blacksmith or welder.

If you want to rust your trap, soak it with salt water once or twice a day for up to two weeks until it's turned to the desired color.
